## **Section 1: Stormwater Calculations Summary**

### ***Pre-Development Conditions***

The project site is located at the southeast corner of Eastview Drive and Upper Shelbyville Road in the City of Franklin, Johnson County, Indiana. The existing site consists mainly of cultivated agricultural field with a few areas of clustered trees. Runoff from the existing site discharges from the property at four (4) main outlet points; however, the entire site is located within the same watershed and all outlet points drain directly to Hurricane Creek. The majority of the site (Basin #1 and 2) sheet flows towards two (2) swales in the middle of the property. The southern swale flows east to west and discharges into two (2) 30-inch diameter CMP twin culverts at the intersection of Eastview Drive and Upper Shelbyville Road. The northern swale also flows east to west and discharges into a 24-inch diameter CMP culvert crossing Upper Shelbyville Road, northeast of the twin culverts. The southwest corner of the site (Basin #3) discharges by sheet flow to an existing roadside ditch located in the right-of-way of Eastview Drive, which then flows north to the intersection of Eastview Drive and Upper Shelbyville Road. The northeast corner of the site (Basin #4) sheet flows north to an existing pipe culvert across Upper Shelbyville Road, and then discharges to Hurricane Creek. There are two (2) off-site areas (OFF-1 and OFF-2) that drain through the property in existing conditions from the adjacent golf course. Lastly, a small area at the northeast corner of the site (DIR. NE) directly discharges from the property by sheet flow to the east. Refer to Exhibit 1: Pre-Development Watershed Map for the existing drainage basins. According to the U.S. Fish and Wildlife Service - National Wetlands Inventory, there are no wetlands present on the site. Also, the vast majority of the property lies within Zone 'X', areas outside of the 0.2% annual chance floodplain, as shown on the Flood Insurance Rate Map (FIRM) for Johnson County, Indiana, Community Panel No. 18081 C 0231D and 18081 C 0232D, dated August 2, 2007. A small portion of the site at the southeast corner of the Eastview Drive and Upper Shelbyville Road intersection does lay within Zone 'AE', special flood hazard areas subject to inundation by the 1% annual chance flood, with base flood elevations (BFE) determined. The BFE within this area is approximately 729.50.

### ***Post-Development Conditions***

The proposed development is to include 145 single-family homes with all necessary street, drainage and utility infrastructure. The development will include three (3) separate sections: Village Green, Homesteads, and Preserve. There will be a total of 33 lots within the Village Green section at a density of approximately 2.7 units/acre; 89 larger-sized lots are proposed within the Homesteads section at a density of approximately 1.7 units/acre; and 23 of the largest lots are proposed within the Preserve section at a density of approximately 1.4 units/acre. The development will also consist of a companion golf course use. As a portion of the development lies within Zone 'AE', as discussed above, the finished floor elevation of the proposed buildings will be located two (2) feet above the determined base flood elevation. Per FIRM Panel No. 18081 C 0231D and 18081 C 0232D, the maximum base flood elevation across the proposed construction limits is identified as 729.50; therefore, the minimum building finish floor elevations will be at a minimum of 731.50. All construction and cut/fill operations for the development will remain outside of the designated floodplain area. All required drives, sidewalks, drainage facilities and utilities shall be constructed per City of Franklin standards.

Existing water, sanitary sewer, telephone, gas, and electric utilities shall be utilized to serve the proposed development.

All stormwater from the disturbed area shall be collected via a storm sewer network that will treat for both quantity and quality. Stormwater quantity and quality requirements of Section 6.19 of the City of Franklin Subdivision Control Ordinance will be satisfied by the installation of four (4) on-site wet detention ponds with restrictive outlet control measures (see Exhibit 2: Post-Development Watershed Map). All on-site impervious areas and off-site areas draining to the development will be routed to, and treated by, the proposed ponds. All ponds will have an ultimate discharge into existing, working outlet points, including two (2) existing road culverts (**Outlets #1 and 2**) and an existing roadside ditch (**Outlet #3**). To achieve water quantity detention standards, the ponds and associated outlet structures will be sized to restrict the peak discharge rates of the 10-year post-developed storm to the combination of the peak 2-year pre-developed rates for all on-site areas and 10-year pre-developed rates for the off-site flow areas. Likewise, the peak discharge rate of the 100-year post-developed storm will be restricted to the combination of the peak 10-year pre-developed rates for all on-site areas and 100-year pre-developed rates for the off-site flow areas.. In post-developed conditions, the right-of-way of Upper Shelbyville Road and the common area at the southeast corner of the intersection will discharge undetained to Hurricane Creek. Therefore, the post-developed flows for these areas will be subtracted from the overall existing discharge rates of the site to determine the allowable release rates for the development. In addition, to achieve water quality standards, the ponds will also be designed to detain, for over 24 hours after the peak runoff from a 24-hour storm, at least 20% of the runoff from either a 1-1/4 inch rainfall depth storm or 1/2 inch direct runoff, whichever is greater. The minimum water quality outlet orifice shall be two (2) inches in diameter. The ponds will also be designed to include an emergency overflow spillway facility that is sufficient to convey 1.25 times the peak discharge resulting from the 100-year post-developed design storm. The wet detention ponds will be designed to meet the requirements of Section 6.19, G and H of the Franklin SCO.

### ***Storm Sewer Design***

The proposed storm sewer network will be designed to accommodate a 10-year storm event. The Rational Method will be used to perform the storm sewer pipe sizing calculations. Structures and grates within pavement areas will be designed and placed so that the depth of ponding above the inlet does not exceed 6 inches at half blocked condition. Also, the storm sewer network will be designed so that the subdivision streets will have a minimum of a 12 foot wide open lane during a 10-year storm event. Structures and grates within grass areas will be designed so that the depth of ponding above the inlet does not exceed 9 inches at half blocked condition.

## **Section 2: Hydrologic Modeling Calculations**

All drainage calculations were completed using Eagle Point Software Watershed Modeling Module. The SCS Curvilinear method utilizing SCS II rainfall distribution was used to calculate the hydrographs. The TR-55 Method was used to calculate times of concentration. Curve numbers were computed based on the applicable land use and the percentage by area of each hydrologic soil type obtained from the NRCS Web Soil Survey. Per Section 6.19.C.6 of the City of Franklin SCO, pre-developed runoff rates shall be based on pasture, meadow, brush or woods ground cover in good hydrologic conditions. As the existing site is predominately grass and cultivated field, the existing ground cover for the entire site will be considered to be pasture cover in good hydrologic condition.

## Hydrologic Modeling Runoff Summary

### Pre-Development Conditions

The City of Franklin Subdivision Control Ordinance requires a detention design that outlets storm water at a two-year pre-development rainfall event rate for a ten-year post-development storm. Also, the 100-year post-development storm shall be limited to the ten-year pre-development rainfall event rate. The 2-year, 10-year and 100-year storm events are calculated at durations of 1, 2, 3, 6, 12 and 24 hours to identify the critical storm events which are to be used for the respective limiting pre-development rates. Tables 4-8 summarizes the peak pre-development runoff rates (cfs) resulting from hydrologic modeling. Entries in bold indicate the critical storm event for the respective return period. See Appendix A for pre-development unit and computed flood hydrograph reports.

## **Section 3: Water Quality Calculations**

The Johnson County Subdivision Control Ordinance requires all paved areas to be routed through a water quality detention system. The water quality detention system shall be designed to detain, for over 24 hours after peak runoff, at least 20% of the volume of runoff from either a 1 ¼" rainfall depth storm or 0.5" of direct runoff, whichever is greater. The minimum water quality outlet shall be 2" in diameter. See Appendix B for water quality hydrographs. See Appendix D for additional water quality data and routed water quality hydrograph.

### **POND #1**

#### **Water Quality Volume**

Volume of Runoff from 1 ¼" Rainfall Depth Storm,  $V_1 = 0.59 \text{ ac.-ft.}$

Volume of Runoff from 0.5" Direct Runoff,

$$V_2 = 21.29 \text{ ac.} * (0.5"/12) = 0.887 \text{ ac.-ft.}$$

Water Quality Volume,  $WQ_v = 20\% * V_2 = 0.2 * 0.887 \text{ ac.-ft.} = \underline{\underline{0.1774 \text{ ac.-ft.}}}$

**At a time of 24 hours after the peak runoff rate of the inflow hydrograph, the detention pond must have at least 0.1774 ac.-ft. remaining in the basin.**

#### **Routed Water Quality Storm Hydrograph**

The hydrograph for the storm producing 0.5" direct runoff is routed through the proposed detention pond with a 4.25" diameter (circular) water quality orifice. The Water Quality Storage Indication Hydrograph (see Appendix D: Proposed Pond Data) is used to verify the water quality volume,  $WQ_v$ , is remaining after 24 hours after peak runoff.

Time to Peak Runoff = 1,092 min.

Time of 24 hours Past Peak Runoff = 1,092 min. + 1,440 min. = 2,532 min.

Storage Volume at Time 2,532 min. = 8,622.96 c.f. = **0.198 ac.-ft. > 0.1774 ac.-ft. ( $WQ_v$ )**

**The storage volume 24 hours after peak runoff is greater than the required water quality volume due to using the minimum size water quality orifice of 4.25".**

### **POND #2**

#### **Water Quality Volume**

Volume of Runoff from 1 ¼" Rainfall Depth Storm,  $V_1 = 0.63 \text{ ac.-ft.}$

Volume of Runoff from 0.5" Direct Runoff,

$$V_2 = 25.00 \text{ ac.} * (0.5"/12) = 1.042 \text{ ac.-ft.}$$

Water Quality Volume,  $WQ_v = 20\% * V_2 = 0.2 * 1.042 \text{ ac.-ft.} = \underline{\underline{0.2084 \text{ ac.-ft.}}}$

**At a time of 24 hours after the peak runoff rate of the inflow hydrograph, the detention pond must have at least 0.2084 ac.-ft. remaining in the basin.**

#### **Routed Water Quality Storm Hydrograph**

The hydrograph for the storm producing 0.5" direct runoff is routed through the proposed detention pond with a 9" diameter (circular) water quality orifice. The Water Quality

Storage Indication Hydrograph (see Appendix D: Proposed Pond Data) is used to verify the water quality volume,  $WQ_v$ , is remaining after 24 hours after peak runoff.

Time to Peak Runoff = 968 min.

Time of 24 hours Past Peak Runoff = 968 min. + 1,440 min. = 2,408 min.

Storage Volume at Time 2,408 min.=10,679.68 c.f. = **0.245 ac.-ft.** > **0.2084 ac.-ft.** ( $WQ_v$ )

**The storage volume 24 hours after peak runoff is greater than the required water quality volume due to using the minimum size water quality orifice of 9".**

### **POND #3**

#### **Water Quality Volume**

Volume of Runoff from 1 1/4" Rainfall Depth Storm,  $V_1$  = 0.28 ac.-ft.

Volume of Runoff from 0.5" Direct Runoff,

$$V_2 = 21.94 \text{ ac.} * (0.5"/12) = 0.914 \text{ ac.-ft.}$$

Water Quality Volume,  $WQ_v$  = 20% \*  $V_2$  = 0.2 \* 0.914 ac.-ft. = **0.1828 ac.-ft.**

**At a time of 24 hours after the peak runoff rate of the inflow hydrograph, the detention pond must have at least 0.1828 ac.-ft. remaining in the basin.**

#### **Routed Water Quality Storm Hydrograph**

The hydrograph for the storm producing 0.5" direct runoff is routed through the proposed detention pond with a 6" x 18" rectangular water quality orifice. The Water Quality Storage Indication Hydrograph (see Appendix D: Proposed Pond Data) is used to verify the water quality volume,  $WQ_v$ , is remaining after 24 hours after peak runoff.

Time to Peak Runoff = 1,208 min.

Time of 24 hours Past Peak Runoff = 1,208 min. + 1,440 min. = 2,648 min.

Storage Volume at Time 2,648 min.=14,855.76 c.f. = **0.341 ac.-ft.** > **0.1828 ac.-ft.** ( $WQ_v$ )

**The storage volume 24 hours after peak runoff is greater than the required water quality volume due to using the minimum size water quality orifice of 6"x18".**

### **POND #4**

#### **Water Quality Volume**

Volume of Runoff from 1 1/4" Rainfall Depth Storm,  $V_1$  = 0.23 ac.-ft.

Volume of Runoff from 0.5" Direct Runoff,

$$V_2 = 24.06 \text{ ac.} * (0.5"/12) = 1.003 \text{ ac.-ft.}$$

Water Quality Volume,  $WQ_v$  = 20% \*  $V_2$  = 0.2 \* 1.003 ac.-ft. = **0.2006 ac.-ft.**

**At a time of 24 hours after the peak runoff rate of the inflow hydrograph, the detention pond must have at least 0.2006 ac.-ft. remaining in the basin.**

### **Routed Water Quality Storm Hydrograph**

The hydrograph for the storm producing 0.5" direct runoff is routed through the proposed detention pond with a 9" x 18" rectangular water quality orifice. The Water Quality Storage Indication Hydrograph (see Appendix D: Proposed Pond Data) is used to verify the water quality volume,  $WQ_v$ , is remaining after 24 hours after peak runoff.

Time to Peak Runoff = 1,034 min.

Time of 24 hours Past Peak Runoff = 1,034 min. + 1,440 min. = 2,474 min.

Storage Volume at Time 2,474 min. = 24,153.13 c.f. = **0.554 ac.-ft.** > **0.2006 ac.-ft.**  
( $WQ_v$ )

**The storage volume 24 hours after peak runoff is greater than the required water quality volume due to using the minimum size water quality orifice of 9"x18".**

**The water quality orifices are discussed further in Section 4: Detention Calculations.**

## **Section 4: Detention Calculations**

Stormwater detention is addressed by detaining the peak discharge rates of the 10-year post-developed storm to the combination of the peak 2-year pre-developed rates for all on-site areas and 10-year pre-developed rates for the off-site flow areas. Likewise, the peak discharge rate of the 100-year post-developed storm will be restricted to the combination of the peak 10-year pre-developed rates for all on-site areas and 100-year pre-developed rates for the off-site flow areas.. In post-developed conditions, the right-of-way of Upper Shelbyville Road and the common area at the southeast corner of the intersection will discharge undetained to Hurricane Creek. Therefore, the post-developed flows for these areas will be subtracted from the overall existing discharge rates of the site to determine the allowable release rates for the development. See Appendices A & B for pre- and post-development hydrograph reports, respectively. See Appendix C for the proposed pond data.

### **Allowable Discharge Rate (see Section 2: Hydrologic Modeling Calculations, Hydrologic Modeling Runoff Summary)**

Allowable Discharge Rate for the 10-year post-development storm =

**25.97 cfs**

Allowable Discharge Rate for the 100-year post-development storm =

**76.39 cfs**

### **Post-Development Peak Flowrate (see Section 2: Hydrologic Modeling Calculations, Hydrologic Modeling Runoff Summary)**

#### **POND #1**

$Q_{10} = 78.05 \text{ cfs}$

$Q_{100} = 128.75 \text{ cfs}$

#### **POND #2**

$Q_{10} = 95.52 \text{ cfs}$

$Q_{100} = 158.48 \text{ cfs}$

#### **POND #3**

$Q_{10} = 68.22 \text{ cfs}$

$Q_{100} = 122.10 \text{ cfs}$

#### **POND #4**

$Q_{10} = 58.05 \text{ cfs}$

$Q_{100} = 108.08 \text{ cfs}$

### **Outlet Structure Summary (see Appendix C: Reservoir and Routing Data, Outlet Structure Reports)**

#### **POND #1**

The proposed outlet structure shall utilize a Type "E" inlet with a 4.25" diameter circular orifice and a 9" by 21" rectangular orifice. Discharge shall leave the outlet structure via a 30" RCP.

POND #2

The proposed outlet structure shall utilize a Type "E" inlet with a 9" diameter circular orifice and a 12" by 24" rectangular orifice. Discharge shall leave the outlet structure via a 24" RCP.

POND #3

The proposed outlet structure shall utilize a Type "E" inlet with a 6" by 18" rectangular orifice and a 6" by 18" rectangular orifice. Discharge shall leave the outlet structure via a 12" RCP.

POND #4

The proposed outlet structure shall utilize a Type "E" inlet with two (2) 9" by 18" rectangular orifices. Discharge shall leave the outlet structure via a 18" RCP.

**Routed Storm Hydrographs (see Appendix C: Reservoir and Routing Data, Storage Indication Hydrographs)**

POND #1

Peak 10 Year Post-Development Discharge Rate = **8.92 cfs**

Peak 100 Year Post-Development Discharge Rate = **31.72 cfs**

POND #2

Peak 10 Year Post-Development Discharge Rate = **7.85 cfs**

Peak 100 Year Post-Development Discharge Rate = **15.08 cfs**

POND #4

Peak 10 Year Post-Development Discharge Rate = **6.03 cfs**

Peak 100 Year Post-Development Discharge Rate = **11.14 cfs**

**TOTAL POST-DEVELOPED DISCHARGE RATE**

**10-Year = 22.80 cfs < 25.97 cfs (allowable)**

**100-Year = 57.94 cfs < 76.39 cfs (allowable)**

**Therefore, the post-development discharge rate being conveyed to Hurricane Creek from the site is at a flowrate equal to, or less than, their respective allowable discharge rates.**

## FLOOD HYDROGRAPH REPORT

---

Hydrograph Number: 24  
Name: Routed WQ Storm - 0.5" Direct  
Type: Reservoir: Storage Indication

### [HYDROGRAPH INFORMATION]

Peak Flow (Qp)	=	0.37 (cfs)
Time to Peak (Tp)	=	1092.00 (min)
Time of Base (Tb)	=	2880.00 (min)
Volume	=	0.75 (ac-ft)
Time Step	=	2.00 (min)
Peak Elevation	=	10.75 (ft)
Detention Time	=	NA

### [RESERVOIR STRUCTURE INFORMATION]

Number	=	1
Name	=	Preliminary Pond #1
Storage Type	=	User-Defined Volume
Maximum Storage	=	253873.99 (cu ft)
Maximum Discharge	=	39.46 (cfs)

### [INFLOW HYDROGRAPH INFORMATION]

Number	=	23
Name	=	WQ-Pond #1 - 0.5" Direct
Peak Flow (Qp)	=	14.77 (cfs)
Time to Peak (Tp)	=	722.00 (min)
Time of Base (Tb)	=	1479.59 (min)
Volume	=	0.89 (ac-ft)
Flow Multiplier	=	1.00

### [EQUATION]

$$0.5(I1+I2)dt + S1-0.5(O2)dt$$

Where:

I1 = Previous Inflow  
I2 = Current Inflow  
dt = Time increment  
S1 = Previous Storage  
S2 = Current Storage  
O1 = Previous Outflow  
O2 = Current Outflow

$$A = 0.5 (I1+I2) dt$$

$$B = S1 - 0.5 (O1) dt$$

$$C = S2 + 0.5 (O2) dt$$
