DRAINAGE COMPUTATIONS SUMMARY

For

I-65 South Logistics Center

State Road 44 & Forest Road

Franklin, IN 46131

PROJECT DESCRIPTION

The proposed project is located at the intersection of State Road 44 and Forest Road in Franklin, Johnson County, Indiana. The ±68.75 acre site currently consists of undeveloped farmland with no existing stormwater infrastructure onsite. The developed site will consist of a ±979,200 sf industrial warehouse facility, asphalt and concrete paving, installation of storm sewer piping and other associated utilities. In addition, a stormwater detention basin will be constructed to detain additional runoff from the proposed site improvements. Refer to Appendix A for an aerial map of the site's location.

The Natural Resources Conservation Service (NRCS) Web Soil Survey of Johnson County, Indiana, indicates an approximately 50.1% distribution of Brookston silty clay loam, a 19.6% distribution of Crosby silt loam, and a 30.3% distribution of Miami silt loam. Refer to Appendix A for the Soils Map.

The site is located within a special flood hazard zone, 'Flood Zone A', as indicated on the Flood Insurance Rate Maps (FIRM) 18081C0232D and 18081C0275D for Johnson County, Indiana, dated August 2, 2007. Compensatory storage for fill placed within the floodplain has been provided per City of Franklin requirements. Refer to Appendix A for the FIRM.

The adjacent land uses for this site have been included below:

North: Agriculture

South: Agriculture

East: Agriculture

West: Agriculture

EXISTING CONDITIONS

The existing property currently consists of undeveloped farmland. In the existing condition, stormwater runoff from the site is allowed to sheet flow un-detained across the site from west to east before eventually discharging to Amity Ditch east of the project site. No existing stormwater infrastructure exists on the project site.

The allowable release rates for the project site has been determined in accordance with the *City of Franklin Subdivision Control Ordinance* which requires runoff to be detained to 2-yr pre-existing rates in 10-year return storm events and to 10-yr pre-existing rates in 100-year storm events. The existing release rates have been summarized in the table below. Refer to Appendix B for Existing Drainage Conditions.

Storm Event	Existing Release Rates
2-Year	6.37 cfs
10-Year	13.51 cfs
100-Year	41.85 cfs

Table 1. Site Existing Release Rates

PROPOSED CONDITIONS

The proposed development includes the construction of a ±979,200 sf industrial warehouse facility, asphalt and concrete paving, installation of storm sewer piping and other associated utilities. The stormwater from the development will be collected in proposed storm infrastructure and conveyed to a new detention basin located on the east side of the property. The stormwater will eventually discharge to Amity Ditch.

Proposed conditions release rates have been modeled in ICPR and have been summarized in the table below. Due to the project's ultimate discharge into Amity Ditch, tailwater from upstream areas contributing to Amity Ditch were incorporated into the ICPR model to analyze the effects of the upstream stormwater on the detention basin as well as release rates into the ditch. As a result of this analysis, it was found that the peak discharge from the detention basin and the peak discharge through Amity Ditch from upstream areas did not occur at the same time and that tailwater effects on the proposed detention caused minimal impact to the intended function of the basin. Refer to Appendix C for a Proposed Conditions Basin Map and runoff calculations.

Storm Event	Existing Release Rates	Allowable Release Rates	Proposed Release Rate
10-Year	13.51 cfs	6.37 cfs	6.36 cfs
100-Year	41.85 cfs	13.51 cfs	7.55 cfs

Table 2. Release Rate Summary

In addition to the modeling of tailwater in Amity Ditch, a second ICPR model was created to analyze the detention basin negating all storage volume below the floodplain base flood elevation. The purpose of this model is to ensure the detention basin has enough storage volume to accept the 10 and 100 year rainfall events without overtopping in the event of a fully flooded Amity Ditch. Refer to Appendix C for all proposed detention calculations.

COMPENSATORY STORAGE

Due to the project site's location within 'Flood Zone A', compensatory storage will be required for all fill placed within the floodplain. Amity Ditch has a base flood elevation of 717.80 for this segment of the ditch.

In the existing site conditions, it was determined that the site provided approximately 52,236 cy of floodplain storage within the property boundary limits. The proposed project will provide the compensatory storage within the detention basin to ensure no floodplain storage is lost as a result of the development. The table below summarizes pre and post floodplain volumes across the site.

	Volume
Existing	52,236 cy
Proposed	56,643 cy

Table 3. Floodplain Storage Volume

AMERICAN STRUCTUREPOINT, INC.

In addition to the detention modeling analysis described above, a third ICPR model was created to analyze the impact of stormwater runoff generated from the project site only. It was found that runoff from the site caused the basin to stage to an elevation of 713.36 in the 100-yr storm which was then used to generate the compensatory storage volume provided in Table 3. Refer to Appendix C for all compensatory storage calculations.

STORM SEWER DESIGN

The proposed storm sewer has been designed based on a 10-year storm event in accordance with the *City of Franklin Stormwater Management Ordinance*. All proposed storm has been sized to accept runoff from the fully developed project site. A storm basin map can be found in Appendix D of the report.

STORMWATER QUALITY

The proposed wet detention basin has been designed to act as water quality for the development in accordance with the *City of Franklin Stormwater Management Ordinance*. The required WQv for the basin based on full buildout of the site is 3.74 ac-ft. The water quality volume provided below normal pool is 57.58 ac-ft. Refer to Appendix E for water quality volume calculations.

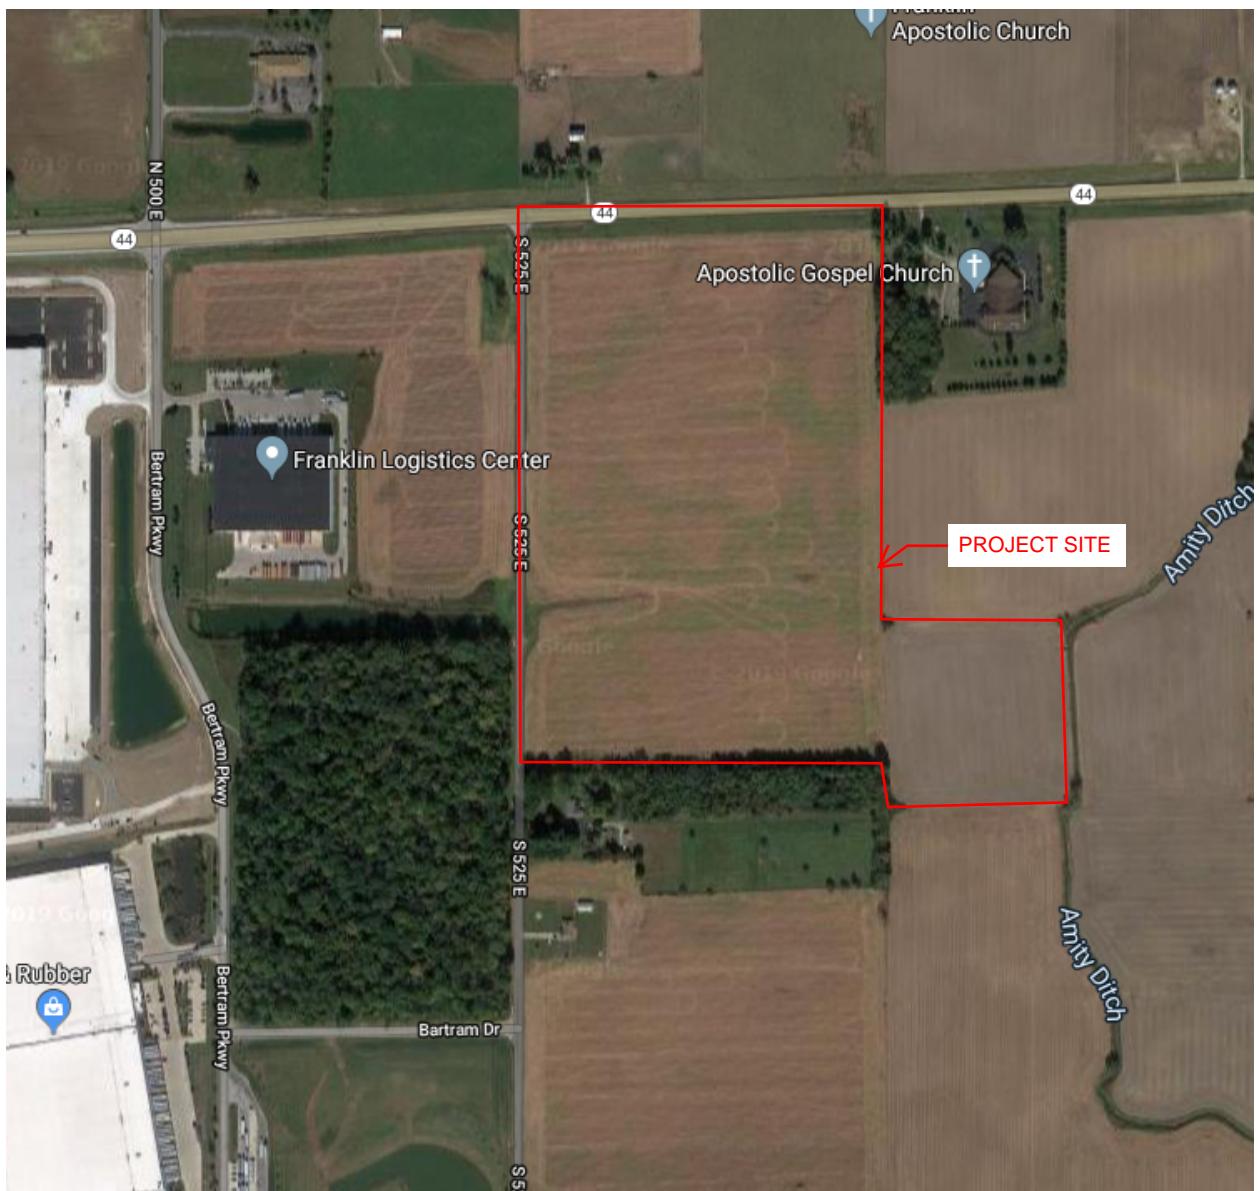

SUMMARY AND CONCLUSIONS

The proposed storm sewer and site improvements have been designed in accordance with the *City of Franklin Subdivision Control Ordinance*. In addition, post developed peak discharge rates for the proposed development will be restricted to rates less than the pre-developed conditions. The detention basin will act as water quality to remove sediment and other solids from the stormwater prior to discharge from the site. We believe the proposed improvements will not adversely affect this site, adjacent developments, the City of Franklin, or Johnson County.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:15,800.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service

Web Soil Survey URL:

Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Johnson County, Indiana

Survey Area Data: Version 27, Sep 16, 2019

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Sep 24, 2014—Mar 20, 2017

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Hydrologic Soil Group

Description

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.

The pin displayed on the map is an approximate point selected by the user and does not represent an authoritative property location.

This map complies with FEMA's standards for the use of digital flood maps if it is not void as described below. The basemap shown complies with FEMA's basemap accuracy standards

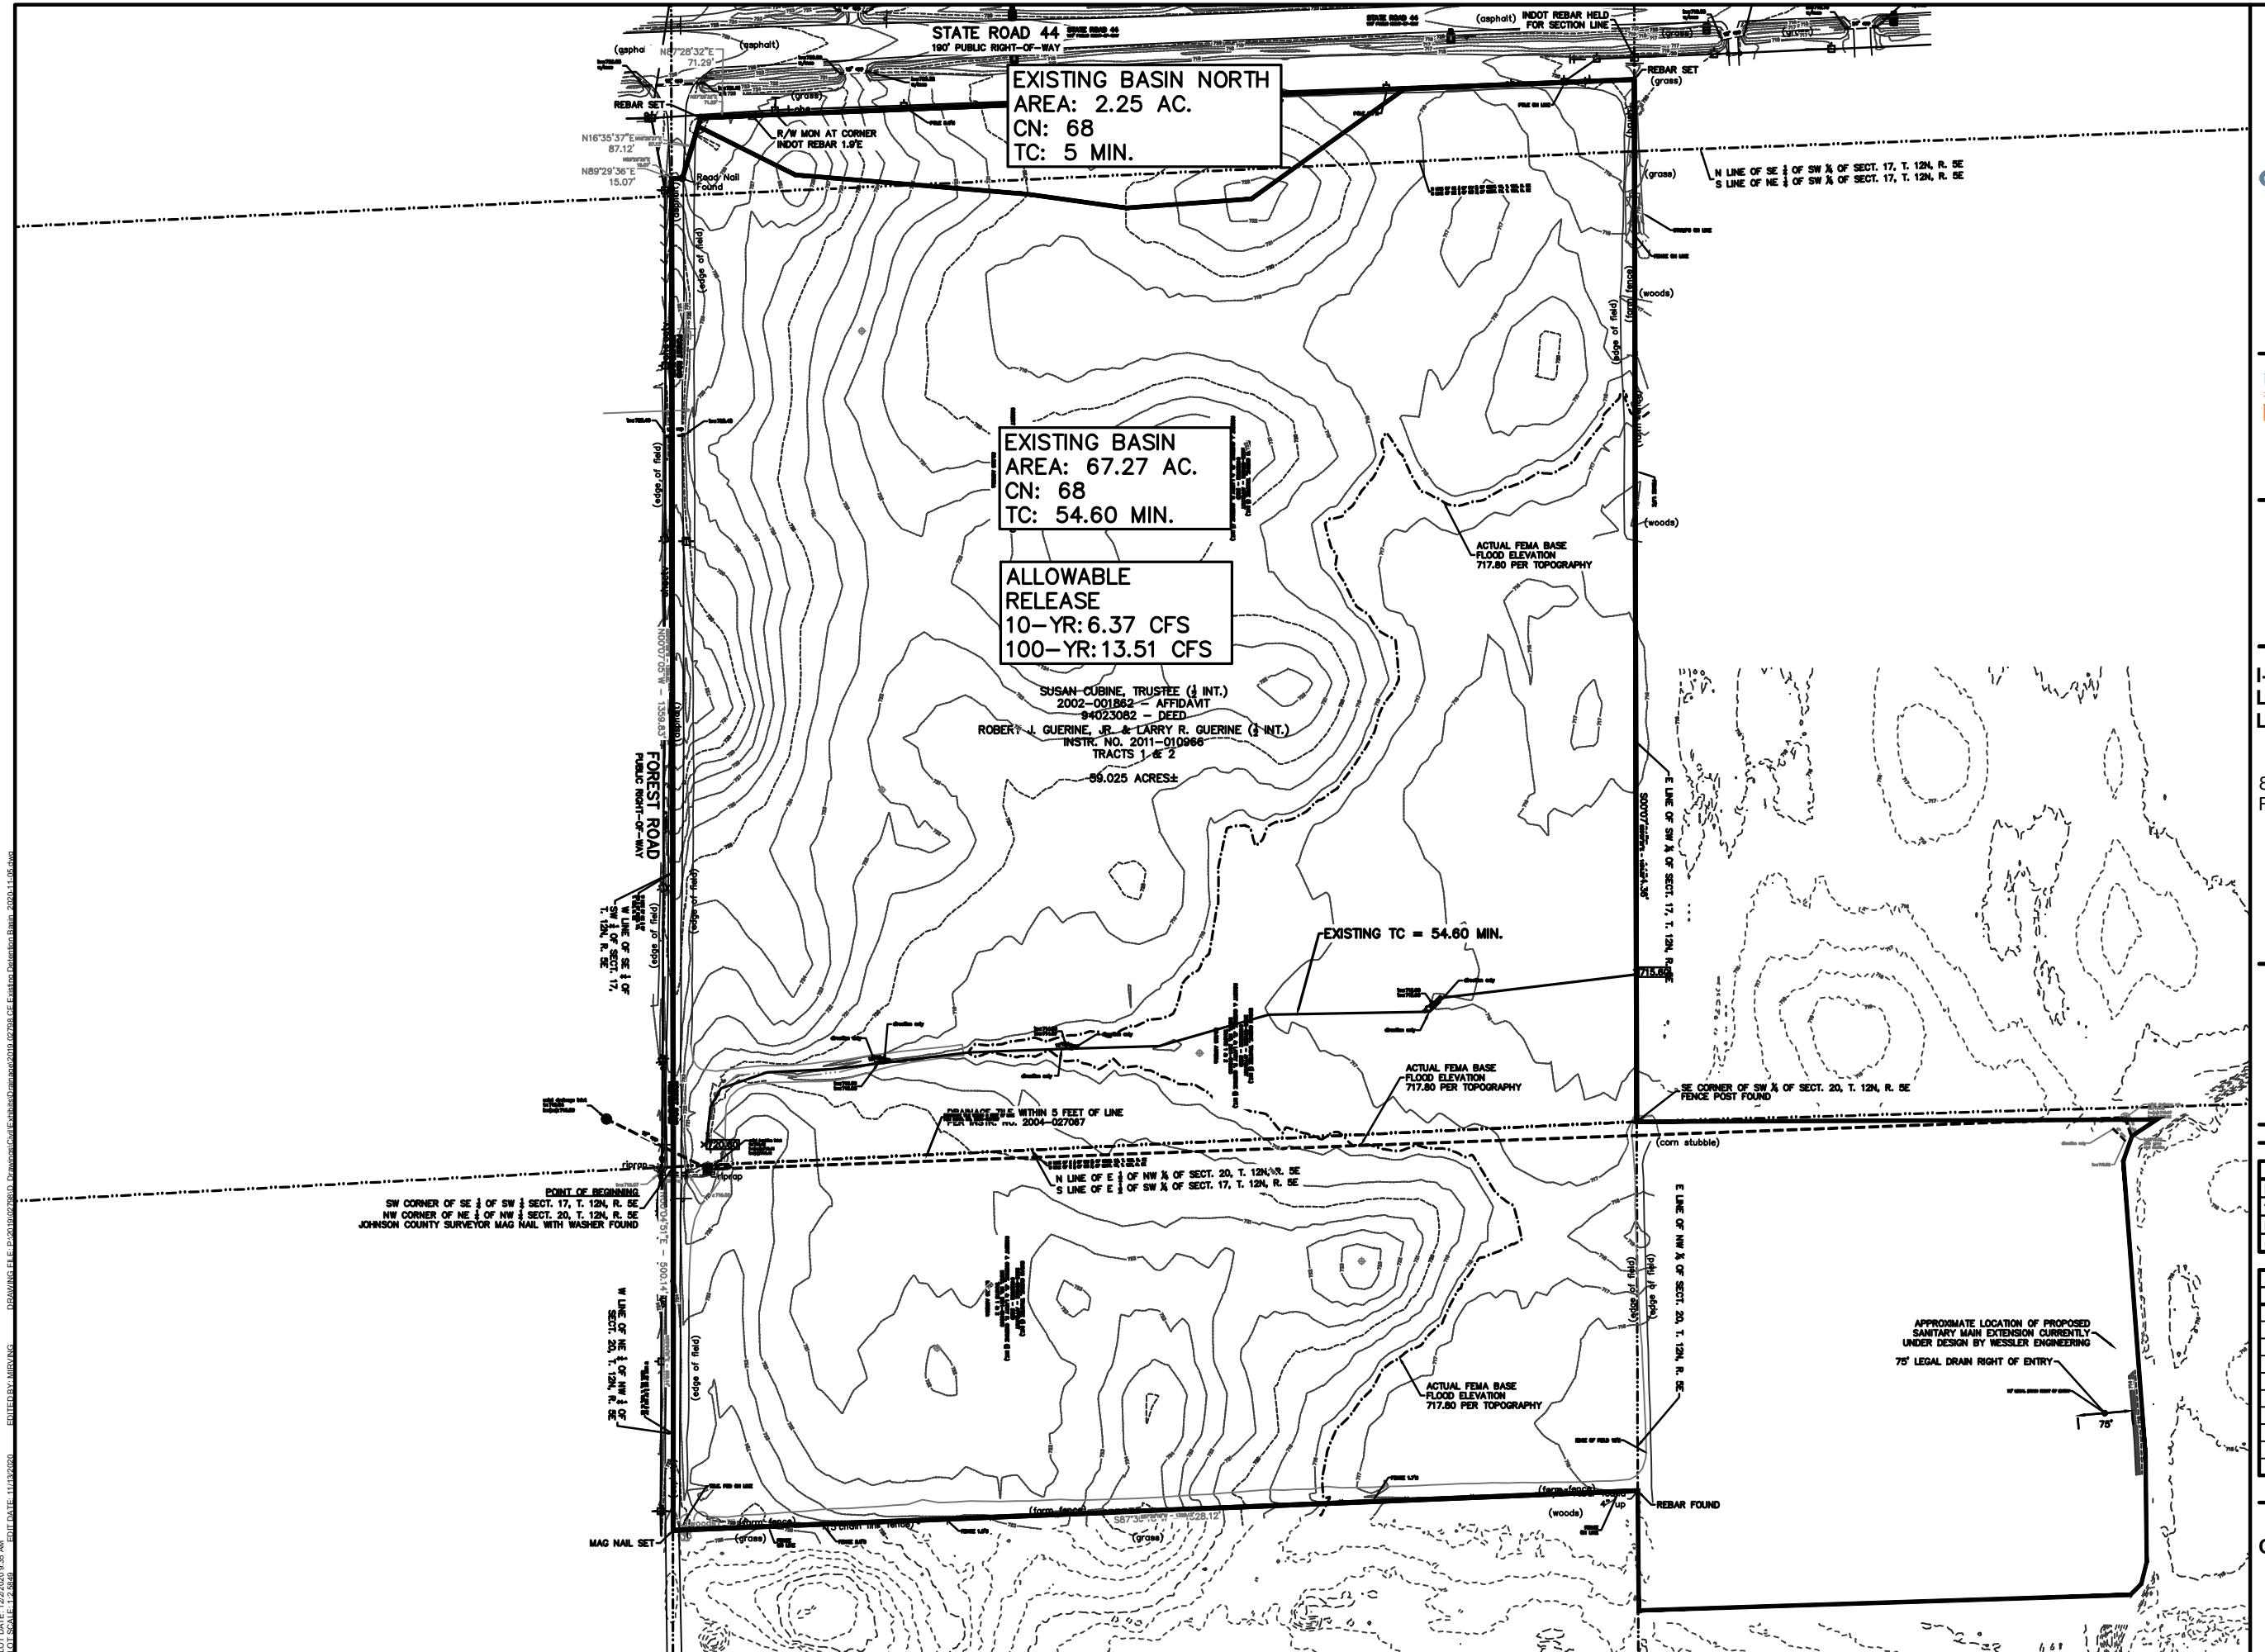

The flood hazard information is derived directly from the authoritative NFHL web services provided by FEMA. This map was exported on 1/8/2020 at 7:13:32 PM and does not reflect changes or amendments subsequent to this date and time. The NFHL and effective information may change or become superseded by new data over time.

This map image is void if the one or more of the following map elements do not appear: basemap imagery, flood zone labels, legend, scale bar, map creation date, community identifiers, FIRM panel number, and FIRM effective date. Map images for unmapped and unmodernized areas cannot be used for regulatory purposes.

¹ Precipitation frequency (PF) estimates in this table are based on frequency analysis of partial duration series (PDS).

Numbers in parenthesis are PF estimates at lower and upper bounds of the 90% confidence interval. The probability that precipitation frequency estimates (for a given duration and average recurrence interval) will be greater than the upper bound (or less than the lower bound) is 5%. Estimates at upper bounds are not checked against probable maximum precipitation (PMP) estimates and may be higher than currently valid PMP values.

Please refer to NOAA Atlas 14 document for more information.

Basin Characteristics

Parameter	Code	Parameter Description	Value	Unit
CONTDA		Area that contributes flow to a point on a stream	2.138	square miles
CSL10_85		Change in elevation divided by length between points 10 and 85 percent of distance along main channel to basin divide - main channel method not known	7.51	feet per mi
URBAN		Percentage of basin with urban development	2.8	percent
HIGHREG		HIGHREG	1008	dimensionless
DRNAREA		Area that drains to a point on a stream	2.138	square miles

Parameter	Code	Parameter Description	Value	Unit
	BFREGNO	BFREGNO	1566	dimensionless
K1INDNR		Average hydraulic conductivity (ft/d) for the top 70 ft of unconsolidated deposits from InDNR well database.	35	ft per day
BSLDEM10M		Mean basin slope computed from 10 m DEM	0.91	percent

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:15,800.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service

Web Soil Survey URL:

Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Johnson County, Indiana

Survey Area Data: Version 27, Sep 16, 2019

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Sep 24, 2014—Mar 20, 2017

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Description

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.

APPENDIX E

PROPOSED CONDITIONS – WATER QUALITY

PROPOSED STORMWATER SYSTEM
WATER QUALITY VOLUME CALCULATIONS

Job Information

Description: I-65 Logistics Center
Reviewing Entity: City of Franklin
Job Number: 2019.02798
Date: 03/19/21

Detention Pond

$$WQv = \frac{(P) * (Rv) * (A)}{12}$$

P = 1" rainfall

Rv = 0.05 + 0.009(I) where I is the percent impervious cover

A = area in acres

PARAMETERS

P =	1.00	(in)
Pervious Area	14.75	
Impervious Area	46.53	
I =	75.9%	(%)
Rv =	0.73	
A =	61.27	(acres)

CALCULATED WQv

$$WQv = 3.74 \text{ (ac-ft)}$$

163119.99 (ft³)

	Pool			
	Stage	Area	Incremental Volume	Volume
	(ft)	(acre)	(acre-ft)	(acre-ft)
Below Normal Pool	700.00	4.53	0.00	0.00
	708.92	6.16	47.68	47.68
	709.92	6.79	6.48	54.16
	710.42	6.89	3.42	57.58
	Total Volume			57.58

> 11.23
