1.0. Project Summary

Project Name: Franklin Industrial
Location: Jim Black Road and McClain Drive, Franklin, Johnson County, Indiana
Type: Drainage Report
Reviewing Agency: City of Franklin
Detention Policy: City of Franklin
Water Quality: City of Franklin
Storm Sewer Modeling: Rational Method

Design:

Water Quality: Wet Detention Basin
Receiving Body: The proposed detention basin outlet structure will convey stormwater to an existing culvert in the public right of way to the northeast of the site.

2.0. Introduction

Kimley-Horn and Associates, Inc. has been retained by The Peterson Company, LLC to prepare construction documents and provide civil engineering services for the proposed Franklin Industrial Building (Project). The Project includes the development of approximately 36 acres at the northwest corner of Jim Black Road and McClain Drive in Franklin, Indiana. The project includes the construction of an approximately 539,668 SF industrial building with associated drives and parking. The project also includes three entrances off McClain Drive and one off Jim Black Road. 35' half right of way will be dedicated to the City for Jim Black Road. Utility services will be brought from existing infrastructure to the east of the site along Jim Black Road. Stormwater detention and quality measures will be provided in the form of a wet detention pond at the north of the site.

This Drainage Report focuses on the existing and proposed conditions onsite and provides supporting calculations for storm sewer, detention basin, and stormwater quality best management practice (BMP) sizing based on the *City of Franklin Stormwater Management Ordinance*.

3.0. Existing Conditions

The existing site is currently undeveloped and is used for agricultural purposes. The adjacent property to the north, east and south are similar in nature. The property to the west is an existing industrial building. The site generally drains in one direction. The majority of the site drains to the northeast corner of the property into an existing 48" culvert under Jim Black Road. A significant offsite drainage area to the west currently drains through the site. Refer to **Appendix D** for the Existing Drainage Map.

Aerial Photograph

An aerial photograph of the Project Site has been included in **Appendix A** for reference.

FEMA

The Project Site is located on the Flood Insurance Rate Map number 18081C0232D dated 8/2/2007 and resides within Zone "X", indicating it lies outside of the 500-year flood limits. See **Appendix B** for the FEMA FIRMette.

Soil Characteristics

The Natural Resources Conservation Service (NRCS) Web Soil Survey of Johnson County, Indiana, indicates Brookston silty clay loam and Crosby silt loam on site. A soil map can be found in **Appendix C**.

4.0. Proposed Conditions

General Storm Routing & Provided Detention

The proposed building and associated parking lot and access drives will be constructed on the 36+/- acre property. A wet detention pond will be designed to provide adequate detention for the developed site. In addition, an extended dry detention basin (EDDB) is proposed to convey the west half of the proposed site along with the required offsite runoff coming in from the west connecting to the wet pond. The proposed wet detention pond will be located to the north of the site and the EDDB along the west property line. The ultimate outfall point for the pond will be located to the east of the pond. The outfall will route discharge from the pond to the existing storm infrastructure in the public right of way of Jim Black Road. Proposed storm sewers have been designed to collect surface and roof runoff and route it to the pond. Refer to **Appendix E** for the Proposed Drainage Map.

Proposed Hydrology

The software package HydroCAD was used to size the proposed wet detention pond and EDDB for the project. HydroCAD utilizes areas, runoff curve numbers, times of concentration and rainfall data to calculate runoff hydrographs. Per the *City of Franklin Stormwater Management Ordinance*, the storm water detention designs shall outlet storm water at a 2-year pre-development rainfall event rate for a 10-year post-development storm and shall outlet at a 10-year pre-development rainfall event rate for a 100-year post-development storm. Based on the existing drainage pattern, the allowable release rates from the proposed detention basin are 15.19 cfs and 31.71 cfs for the 10-year and 100-year storms respectively. The existing 48" culvert has sufficient capacity to handle the flow therefore the allowable release rates will not be reduced. The proposed detention wet pond for this project has been sized to provide rate control for 35.86 acres of the project site while being oversized to handle an additional 24.64 acres of offsite drainage from the west. The remaining area (1.84 AC) from the existing basin (37.70 AC) are roadway and dedicated ROW areas where it will drain directly to the discharge point and bypass the pond. A composite curve number of 87 was calculated for both on-site basins and 91 for the offsite basin.

The normal pool of the wet pond was set to ensure positive drainage to the outfall invert at the existing storm structure. The release rate from the pond will be controlled by two orifices. The invert of the first

orifice will be set at the normal pool elevation of 725.85 and have a 12" diameter. The invert of the second orifice will be set at the normal pool elevation of 727.25 and have a 30"Wx36"H rectangle. The extended dry detention basin (EDDB) will provide intermediate rate control while conveying the site as well as offsite runoff. The table below summarizes the water surface elevations and release rates for the pond. Refer to **Appendix F** for detailed HydroCAD calculations.

Pond	10-YR Release Rate (cfs)	100-YR Release Rate (cfs)	100-YR Water Surface Elevation	T/Berm
Allowable	15.19	31.71		
Wet Pond (Without Offsite)	3.51	9.18	727.92	730.35
Wet Pond (With Offsite)	10.90	27.18	729.14	730.35
EDDB with offsite	122.26	213.50	729.31	

The emergency overflow weir was designed using 1.25 times the maximum flow into the pond. As seen in **Appendix F** of this report, the peak flow into the pond is 286.32 CFS resulting in the design flow rate for the overflow weir to be 357.9 cfs. A 71-ft wide trapezoidal weir and 12" height was modeled with a 4:1 side slope on both sides. The spillway is designed to be set at the 100 YR HWL elevation of 729.14. The resulting maximum overflow elevation is 730.14. The top of bank is set at 730.35 in order to provide the minimum required two feet of freeboard above the 100 YR HWL elevation (without offsite flow). All building foundations are set to a minimum 2.0-ft above the overflow elevation. Weir calculations can be found shown in **Appendix F**.

Proposed Hydraulics

The proposed storm sewer conveyance system was designed to meet the City requirements using HydraFlow Storm Sewer Extensions, Version 2020. The HGL of the 10-yr storm was kept below the proposed rim elevations of each structure. Rainfall intensities and 'c' values were taken from the *City of Franklin Stormwater Management Ordinance* were inputted into the model. The storm sewers were designed to maintain a minimum full flow velocity of 2.5 ft/s.

A Storm Sewer Drainage Area Map has been provided in **Appendix E** and the output solution from the Hydraflow Analysis and inlet capacity calculations are provided in **Appendix G**.

Submerged System & Flood Route

Due to the size of the site with significant topography limitations, this project proposes submerged storm sewer systems where the crown of the outfall pipe for each set of storm sewers will be placed at or lower than the pond's normal pool elevation. This is done to minimize impacts and disruptions during freeze-thaw periods. Due to the large size of the ponds with significant storage volume capacities, effects of backwater will be too great to neglect as if the system were not submerged. As a result, a sophisticated model using Storm and Sanitary Analysis (SSA) is necessary to model and check both the storm sewers and ponds working in tandem while designing flood routes using resulting overflow and breakaway

elevations. Inputs were mirrored to the individual models for sizing detention ponds and storm sewers as presented in the sections above. The hydrodynamic routing method is used in this model. Per the software's user manual, hydrodynamic routing is the most sophisticated routing method, and solves the complete one-dimensional Saint Venant flow equations to produce the most theoretically accurate results. This method accounts for channel storage, backwater pressurized flow and is the method of choice for systems subjected to significant backwater effects due to downstream flow restrictions.

As shown in **Appendix H** of this report, the calculations prove that the storm sewer system as presented are properly sized and adequate to serve in a submerged state. This model concludes that, as expected, the submerged pipes are shown as surcharged, the resulting 100-year peak flow rates are less than the design capacity while the resulting water depth in the truck docks are less than 7 inches. This indicates that the storm sewer system is sized for 100 year, therefore it is oversized. While this was intentional, it is a measure of redundancy to ensure ease of flow to the pond in the event of accumulated sediment and/or debris. Turnouts and curb cuts should be installed in accordance with the construction plans and the flood route exhibit provided in Appendix H.

Stormwater Quality

Stormwater quality treatment for the project site will be accomplished by routing onsite flow through the proposed detention pond. According to the City of Franklin Subdivisions Standards, "The developer shall be required to provide a water quality detention system that is designed to detain, for over 24 hours after peak run-off from a 24-hour storm, at least 20% of the run-off from either a 1-1/4 inch storm or ½ inch of direct runoff, whichever is greater." With this condition, it is required that the pond have a water quality design volume of 13,017 cubic-feet. It was determined that the provided stormwater quality volume is 49,702 cubic-feet. Refer to **Appendix I** for detailed calculations.

OTHER FEATURES

- Digital Data Available

- No Digital Data Available

- Unmapped

The pin displayed on the map is an approximate point selected by the user and does not represent an authoritative property location.

This map complies with FEMA's standards for the use of digital flood maps if it is not void as described below. The basemap shown complies with FEMA's basemap accuracy standards

The flood hazard information is derived directly from the authoritative NFHL web services provided by FEMA. This map was exported on 7/27/2021 at 10:16 AM and does not reflect changes or amendments subsequent to this date and time. The NFHL and effective information may change or become superseded by new data over time.

This map image is void if the one or more of the following map elements do not appear: basemap imagery, flood zone labels, legend, scale bar, map creation date, community identifiers, FIRM panel number, and FIRM effective date. Map images for unmapped and unmodernized areas cannot be used for regulatory purposes.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:15,800.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service

Web Soil Survey URL:

Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: Johnson County, Indiana

Survey Area Data: Version 28, Jun 4, 2020

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Oct 17, 2019—Oct 20, 2019

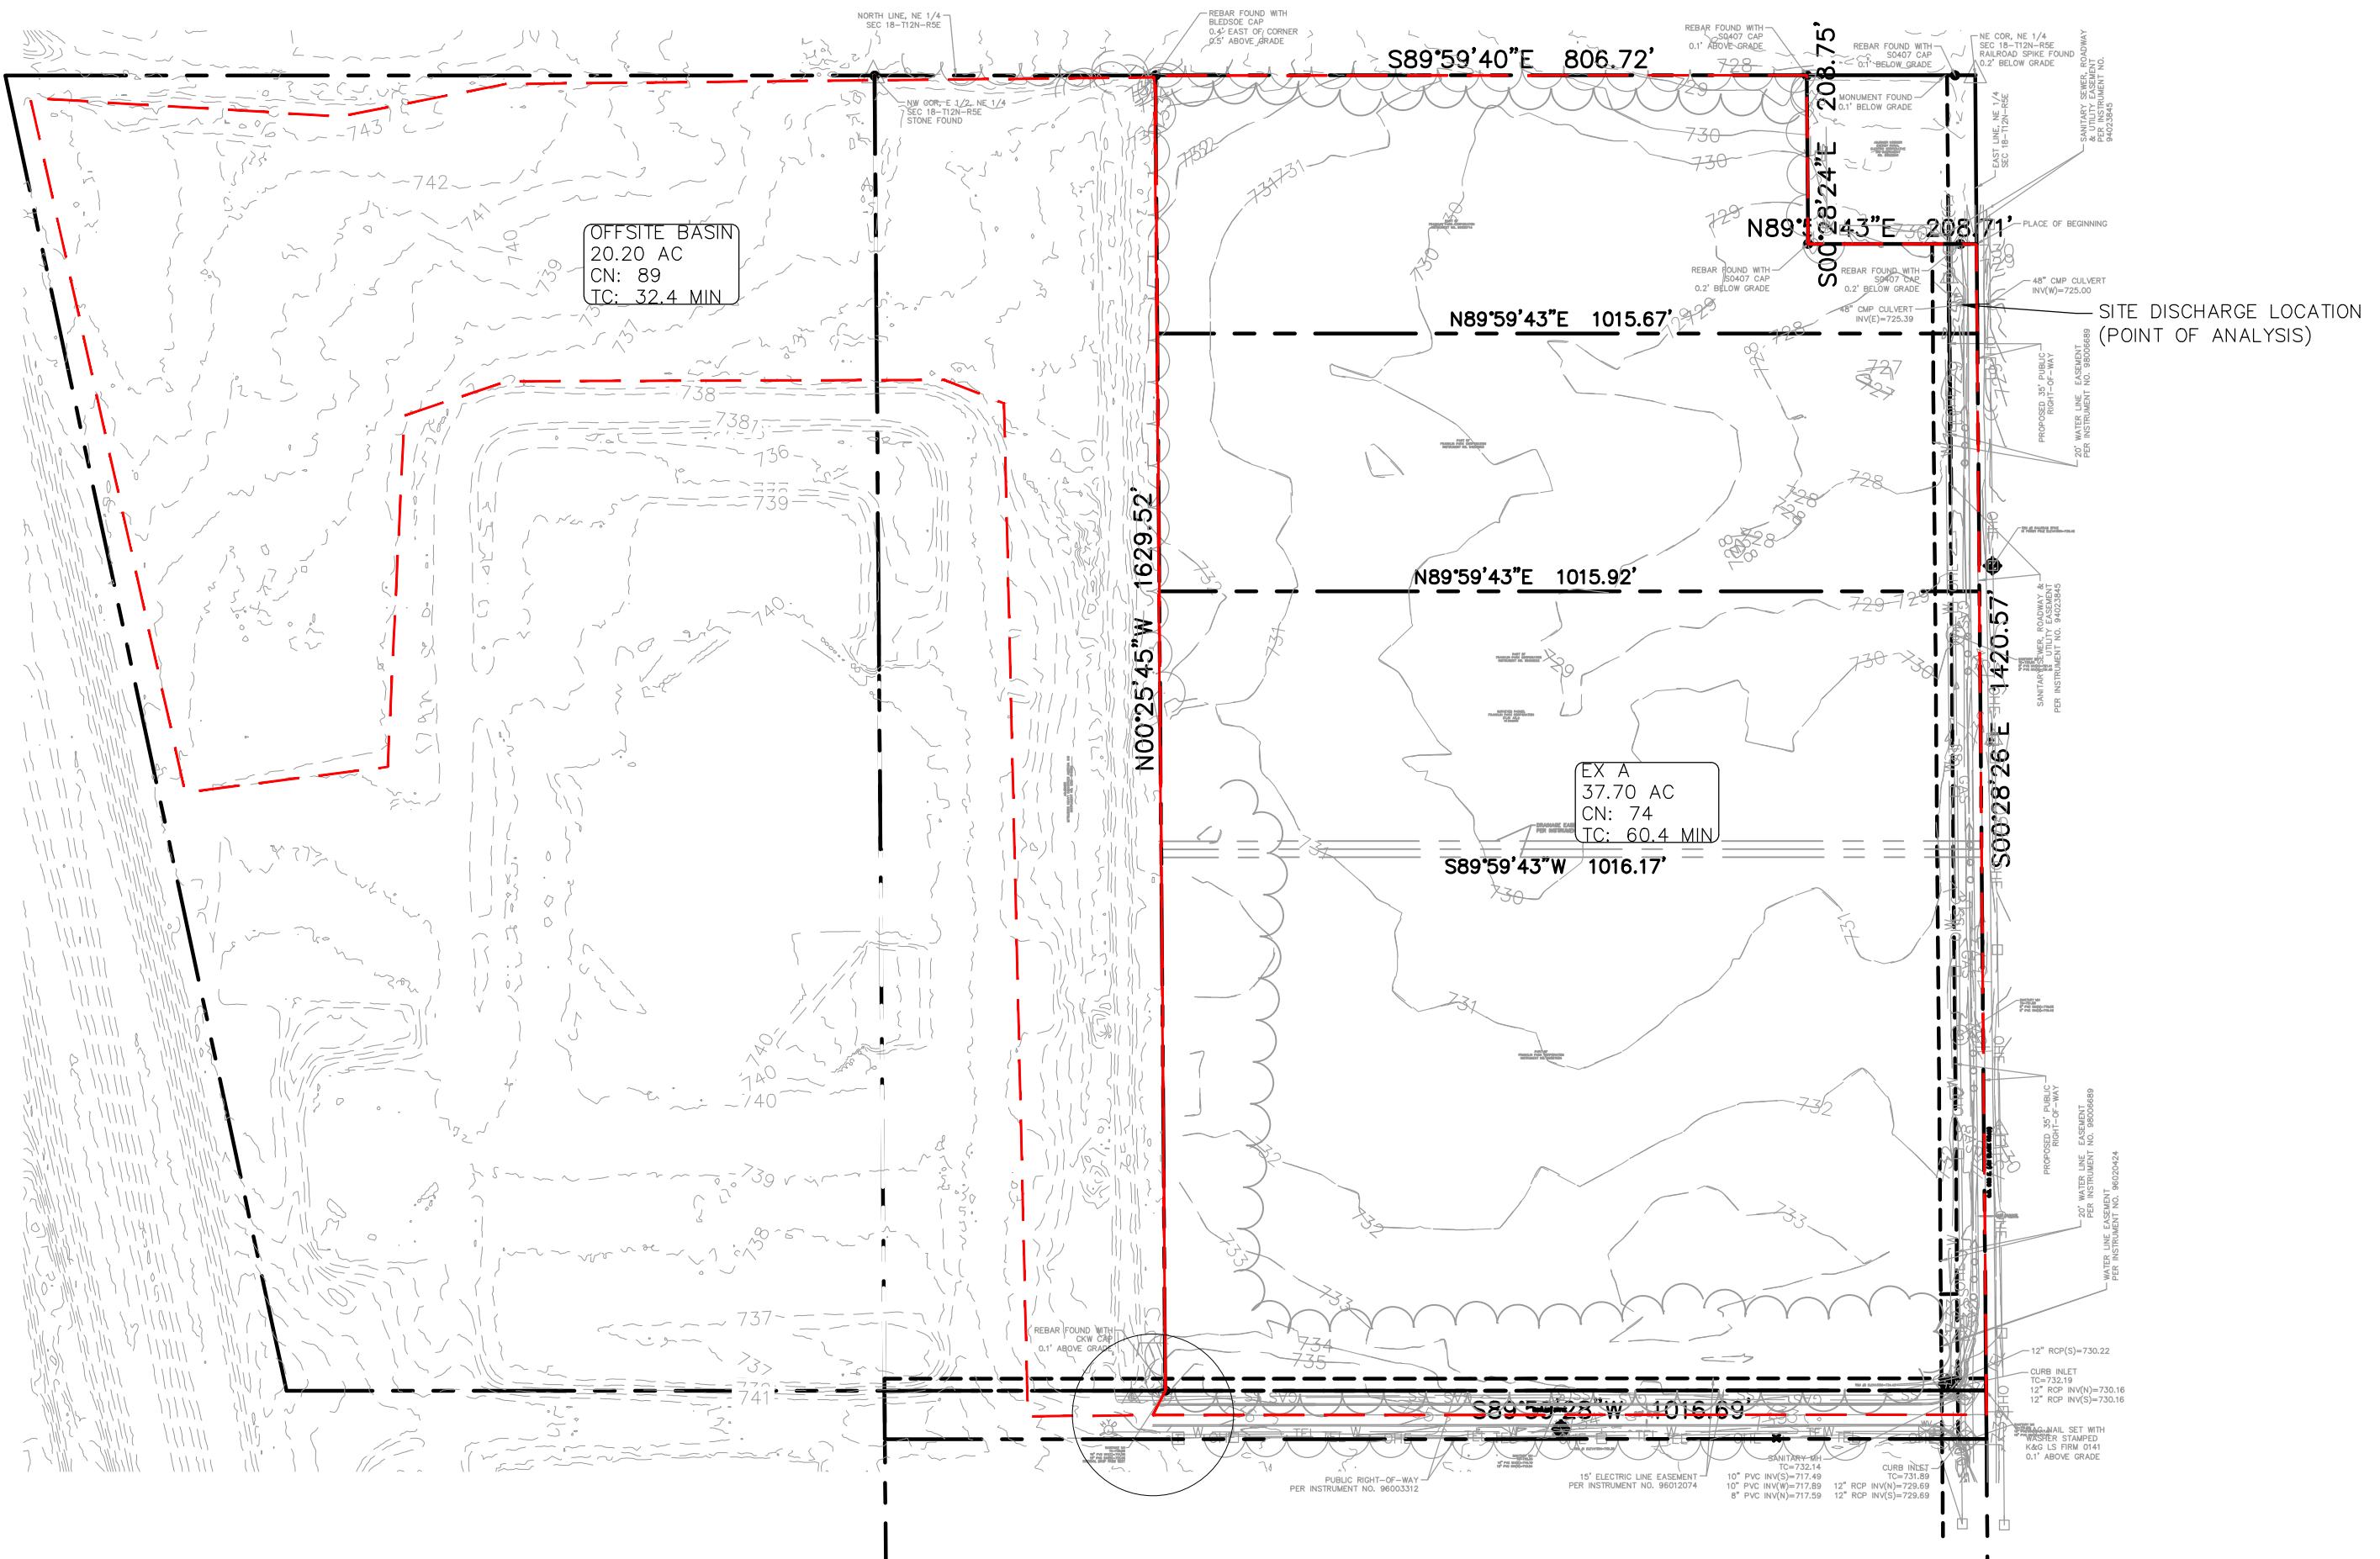

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Map Unit Legend

Appendix H: Submerged Sewer Analysis

Project Description

File Name Franklin_Submerged Analysis.SPF

Project Options

Flow Units CFS
Elevation Type Elevation
Hydrology Method Rational
Time of Concentration (TOC) Method User-Defined
Link Routing Method Hydrodynamic
Enable Overflow Ponding at Nodes YES
Skip Steady State Analysis Time Periods NO

Analysis Options

Start Analysis On Sep 09, 2021 00:00:00
End Analysis On Sep 10, 2021 00:00:00
Start Reporting On Sep 09, 2021 00:00:00
Antecedent Dry Days 0 days
Runoff (Dry Weather) Time Step 0 01:00:00 days hh:mm:ss
Runoff (Wet Weather) Time Step 0 00:05:00 days hh:mm:ss
Reporting Time Step 0 00:05:00 days hh:mm:ss
Routing Time Step 30 seconds

Number of Elements

	Qty
Rain Gages	0
Subbasins.....	14
Nodes.....	18
Junctions	14
Outfalls	1
Flow Diversions	0
Inlets	0
Storage Nodes	3
Links.....	27
Channels	11
Pipes	14
Pumps	0
Orifices	2
Weirs	0
Outlets	0
Pollutants	0
Land Uses	0

Rainfall Details

Return Period..... 100 year(s)

Appendix I: Stormwater Quality Calculations

Water Quality Summary*

Total Onsite Developed Area = 35.86 AC

Volume from 1.25-inch, 24-HR storm (See Appendix E) = 48,177 CF

20% of that value = 9,635 CF

0.5-inches of direct runoff: $V = (35.86 \text{ AC}) * (43,560 \text{ SF}) * (0.5\text{-in}) * (1/12\text{-inch}) = 65,086 \text{ CF}$

20% of that value = 13,017 CF (Greater of two)

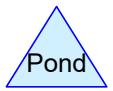

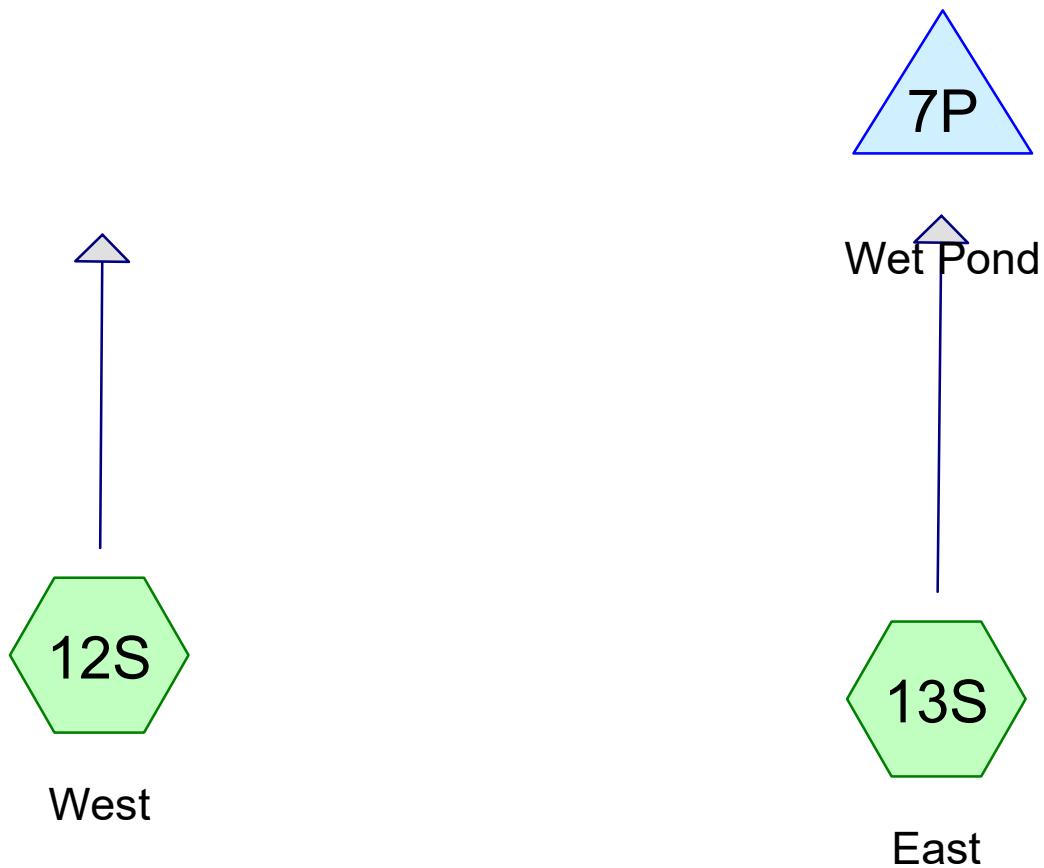

Water Quality Design Volume = 13,017 CF

Time of Peak Runoff = 12 Hours

24-HR after Peak Runoff = Hour 36 of simulation

Volume Stored at Hour 37 (See Appendix F) = 49,702 CF

The proposed site meets the water quality requirement.
